Characteristics of the VCSELs mounted directly to Kovar headers.....	16
Wavelength shifting of the VCSELs.....	24
Conclusions.....	29

Introduction

This report summarizes the evaluation of 850 nm VCSELs manufactured by Emcore. The purpose of the evaluation was determine if the superior thermal properties of diamond as a substrate would improve the performance and reliability of the mounted VCSELs. Four VCSELs were mounted to diamond substrates and four more were mounted directly to Kovar headers and subjected accelerated voltage and current overdrive conditions. The diamond substrates provided a significant reliability advantage, however, there were unexplained shifts in the spectral properties of the devices. These mode shifts could be the subject of further investigation.

Bare die were purchased and mounted onto gold plated CVD diamond substrates 500um in thickness. Die attach was performed using 84-1 conductive epoxy (Ablestik). 1 mil Au thermosonic wire bonding was used. The individual die were mounted on 250 um centers. The substrates were mounted onto TO-8 gold plated kovar headers. A MTP ribbon cable was used as a waveguide to the HP7095 Optical Spectrum Analyzer (OSA) and HP 8153 Lightwave Multimeters.

4 VCSELs were mounted directly on the TO-8 cans to permit comparison of the performance with and without diamond substrates. Due to alignment fiber-VCSEL alignment difficulties, mating and demating of the ribbon cable was kept to a minimum.

Figures 1 and 2 depict the VCSELs unmounted and mounted on diamond. The devices used in the evaluation are no longer available as discrete parts. The next generation is preferred because the devices are available as monolithic arrays. The arrays are preferred because the optical alignment problems with the discrete devices can be eliminated. Figure 2a depicts the bare diamond substrate. Figure 2b is a block diagram of the test setup.

1. VCSEL Optical output power vs bias

Each of the 4 VCSELs are driven by single power supply through a 100 ohm resistor. Table 1 depicts the power output response of the a typical device under swept bias. This device is mounted directly to the TO-8 can

Table 1

PEAK_A is the power of the highest spectral output component. TOT_PO is the sum of the power of all the spectral components. The detected power is less than the actual power due to fiber-VCSEL misalignment. It is interesting to note that divergence of the two curves at the low and high ends of the bias conditions

2. Characteristics of the VCSEL-on-diamond.

The following charts summarize the 41 days of continuous monitoring of the VCSEL-on-diamond units. One of the 4 devices (VCSEL_1) was monitored by the OSA. The other 3 devices (VCSEL_2, _5, _8) were monitored the lightwave multimeter. For the latter devices, the only parameter recorded by the LABVIEW program is total power out. The summary of the raw power out numbers is shown in Table 2

Statistical Summary of Raw Power Output Data (dBm) for VCSEL_1
Table 2

5 V bias

	Observations	Mean Pout	Minimum Pout	Maximum Pout	Std.Dev.
VCSEL_1	674	-17.6358	-18.5157	-16.9374	.284717
VCSEL_5	674	-7.7309	-8.3565	-7.4715	.084840
VCSEL_2	674	-6.4325	-6.8194	-6.0730	.194107
VCSEL_8	674	-8.4453	-8.6328	-8.2102	.114320

6.25 V bias

	Observations	Mean Pout	Minimum Pout	Maximum Pout	Std.Dev.
VCSEL_1	913	-20.3849	-21.0891	-19.7740	.155107
VCSEL_5	913	-9.5464	-9.8297	-9.3930	.059760
VCSEL_2	913	-8.4815	-8.7290	-8.0134	.126077
VCSEL_8	913	-9.1052	-9.4310	-8.6967	.144907

7.5 V bias

	Observations	Mean Pout	Minimum Pout	Maximum Pout	Std.Dev.
VCSEL_1	387	-23.5835	-24.8671	-22.7887	.498200
VCSEL_5	387	-11.8555	-12.2915	-11.5739	.123101
VCSEL_2	387	-12.3018	-12.9328	-11.9314	.156877
VCSEL_8	387	-11.4199	-12.1042	-10.9691	.199144

VCSEL characteristics at 25 C. 5V through 100 Ohm resistor

$$\text{VCSEL_1} = -17.911 + 0.001 \cdot x + \text{eps}$$

$$\text{VCSEL_5} = -7.611 - 0 \cdot x + \text{eps}$$

$$\text{VCSEL_2} = -6.317 - 0 \cdot x + \text{eps}$$

$$\text{VCSEL_8} = -8.282 - 0 \cdot x + \text{eps}$$

Figure 10. Optical Power output summary

3. Characteristics of the VCSELs mounted directly to Kovar headers.

The VCSELs mounted directly to the Kovar headers exhibited a power slump over time. After 2 days at 6.25 V, all 4 devices stopped exhibiting any power output at 850nm.

Figure 11. Comparison of Optical power out on diamond vs Kovar substrate

Table 3

Statistical Comparison of Output power data (dBm) for VCSEL mounted to diamond substrate vs Kovar header over the same number of observations

	Observations	Mean Pout	Minimum Pout	Maximum Pout	Variance	Std.Dev.
PEAK_A	674	-21.2620	-22.1000	-20.8000	.058823	.242534
TOTAL_PO	674	-21.1051	-21.8966	-20.6775	.055431	.235438
PEAK_B	674	-17.7111	-18.6000	-17.0000	.084051	.289916
TOT_PO	674	-17.6358	-18.5157	-16.9374	.081063	.284717

PEAK_A = Peak power of primary spectral peak for Kovar mounted sample

TOTAL_PO = Total power output for Kovar mounted sample

PEAK_B = Peak power of primary spectral peak for diamond mounted sample

TOT_PO = Total power out for diamond mounted sample
